Office Action mailed May 20, 2004
Amendment transmitted July 30, 2004

Attorney Docket 10808/27

This listing of claims replaces all previous listings and versions of claims in the application.

1. (Cancelled)

2. (Currently amended) A delay line comprising at least two of the four-transistor delay units according to Claim 1 connected in series, a four-transistor delay unit, comprising:

a first amplifier having a first and a second transistor connected as a two-transistor positive amplifier, wherein a gate of the first transistor is connected to a drain of the second transistor and a gate of the second transistor is connected to a drain of the first transistor; and

a second amplifier having a third and a fourth transistor, a drain of the third and fourth transistors connected to a drain of the first and second transistors to form output terminals, wherein a differential input voltage is connected to gates of the second amplifier transistors, a control input and power supply voltage controlling the delay is connected to sources of the first amplifier and the delay unit uses substantially all available power supply voltage.

3. (Currently amended) The A delay unit of Claim 1, comprising:

a first amplifier having a first and a second transistor connected as a two-transistor positive amplifier, wherein a gate of the first transistor is connected to a drain of the second transistor and a gate of the second transistor is connected to a drain of the first transistor;

a second amplifier having a third and a fourth transistor, a drain of the third and fourth transistors connected to a drain of the first and second transistors to form output terminals, wherein a differential input voltage is connected to gates of the second amplifier transistors, a control input and power supply voltage controlling the delay is connected to sources of the first amplifier and the delay unit uses substantially all available power supply voltage; and

Attorney Docket 10808/27

Further comprising a fifth and a sixth transistor connected in series with the first and second transistor, the gates of the fifth and sixth transistor connected to their drains.

4. (Cancelled)

5. (Currently amended) A four-transistor differential controlled delay unit, comprising:

a first amplifier having a first and a second transistor connected as a two-transistor positive amplifier, wherein a gate of the first transistor is connected to a drain of the second transistor and a gate of the second transistor is connected to a drain of the first transistor, and the first amplifier transistors are NMOS transistors; and

a second amplifier having a third and a fourth transistor, wherein a drain of the third and fourth transistors is connected to a drain of the first and second transistors to form output terminals, wherein the second amplifier transistors are PMOS transistors, a differential input voltage is connected to gates of the third and fourth transistors, a control input and supply voltage is connected to the sources of the second amplifier, and wherein a delay period is determined by the control input and supply voltage and the delay unit uses substantially all available power supply voltage ~~The delay unit of Claim 4, wherein the first amplifier transistors are NMOS transistors and the second amplifier transistors are PMOS transistors, and wherein the NMOS transistors have a width-to-length ratio of greater than 30 and the PMOS transistors have a width-to-length ratio of greater than 40.~~

6. (Currently amended) A delay line comprising at least two of the four-transistor delay units according to [[Claim 4]] Claim 5 connected in series.

Attorney Docket 10808/27

7. (Previously presented) A voltage controlled oscillator, comprising:
a first delay unit and a second delay unit, each further comprising four
transistors, said delay units each having a first amplifier having a first and a second
transistor connected as a two-transistor positive amplifier, wherein a gate of the first
transistor is connected to a drain of the second transistor and a gate of the second
transistor is connected to a drain of the first transistor, said delay units each having a
second amplifier having a third and a fourth transistor,

wherein a drain of the third and fourth transistors is connected to a drain of the
first and second transistors, said connections forming output terminals of the delay unit,
and

wherein output terminals of the first delay unit are connected to gates of the
second amplifier of the second delay unit, and output terminals of the second delay unit
are connected to gates of the second amplifier of the first delay unit, and wherein a
control input and power supply voltage is connected to sources of the first amplifiers.

8. (Original) The voltage controlled oscillator of Claim 7, wherein the transistors
for the first amplifiers are PMOS transistors and the transistors for the second amplifiers
are NMOS transistors.

9. (Original) The voltage controlled oscillator of Claim 7, wherein a positive
supply voltage is connected to the first amplifiers and a negative supply voltage or
ground is connected to the second amplifiers.

10. (Previously presented) The voltage controlled oscillator of Claim 7, further
comprising an additional delay unit.

Amendment transmitted July 30, 2004

Attorney Docket 10808/27

11. (Previously presented) The voltage controlled oscillator of Claim 7, wherein the transistors for the first amplifiers are PMOS and the transistors for the second amplifiers are NMOS and a drain of the first and second transistors is connected to a drain of the third and fourth transistors to form outputs of the delay units.

12. (Previously presented) The voltage controlled oscillator of Claim 11, further comprising an additional delay unit.

13. (Previously presented) The voltage controlled oscillator of Claim 7, wherein in the first delay unit and the second delay unit, drains of the first amplifier are connected to drains of the second amplifier to form output terminals,

and wherein the output signals of the first delay unit are connected to gates of the second delay unit, and output signals of the second delay unit are connected to gates of the first delay unit, and wherein a control input and power supply voltage is connected to sources of the first and second delay units.

14. (Previously presented) The voltage controlled oscillator of Claim 13, further comprising an additional delay unit, wherein output signals from the second delay unit are connected to gates of the additional delay unit, and output signals of the additional delay unit are connected to gates of the first delay unit.

15. (Cancelled)

16. (Cancelled).

17. (Previously presented) The voltage controlled oscillator of Claim 13, wherein the transistors of the first amplifiers are PMOS and the transistors of the second amplifiers are NMOS.

Attorney Docket 10808/27

18. (Original) The voltage controlled oscillator of Claim 7, further comprising a charge pump and a buffer, wherein a buffered output voltage of the charge pump is a supply voltage to the first amplifiers.

19. (Original) The voltage controlled oscillator of Claim 7, further comprising at least one additional delay unit, wherein output terminals of a delay unit are connected to gates of a next delay unit, and output terminals of a last delay unit are connected to the gates of the first delay unit.

20. (Withdrawn) A phase-locked loop, comprising:

a phase frequency detector;

a charge pump and loop filter connected to the phase frequency detector;

a voltage controlled oscillator having at least two delay units, each delay unit further comprising four transistors, and connected with a supply and control voltage from the charge pump; and

a voltage divider connected between the oscillator and the phase frequency detector.

21. (Withdrawn) The phase-locked loop of Claim 20, further comprising a buffer connected between the charge pump and the voltage controlled oscillator.

22. (Withdrawn) A delay locked loop, comprising:

a phase detector;

a charge pump and loop filter connected with the phase detector;

a buffer amplifier; and

Attorney Docket 10808/27

a voltage controlled delay line having at least two delay units, each delay unit further comprising four transistors, and connected with a supply and control voltage from the charge pump and buffer amplifier, the voltage control oscillator also connected with the phase detector.

23. (Withdrawn) A phase accumulator circuit, comprising:

- a phase frequency detector;
- a charge pump and loop filter, connected with the phase frequency detector;
- a buffer amplifier connected with the charge pump and loop filter;
- a voltage controlled oscillator having at least two delay units, each delay unit further comprising four transistors, and connected with a supply and control voltage from the charge pump and buffer amplifier;
- a phase accumulator, connected with the voltage controlled oscillator and receiving inputs from the oscillator;
- a programmable control input, connected to the phase accumulator; and
- at least one toggle flip/flop, connected to the phase accumulator and receiving inputs from the phase accumulator.
